the party. Now she has decided to share the cake with them also. How much share would all get in total ?

Each gets 2 pieces of cake. Thus 18 pieces of cake is shared equally among 9 members with 2 pieces each.

G3R2V6

Note

Superscript means placing the number in the right side top of the given number as small. e.g. 3^2,6^3

(vi) Short division

Divide 670 ÷ 5

Here 670 is the dividend, 5 is the divisor

Here, 5(the divisor) divides 6(the first digit of the dividend) in 1 time, with the reminder of 1, place the quotient 1, above the long division bar. Place as small superscript 1 beside 6.

$5\overline{)\,6^{1}70}$

Combine it with the next dividend digit to the right. Now find out how many times the divisor divides the new two digit number 11. The divisor divides 11, 3 times, with the remainder of 2, place the quotient 3 above the division line, 2 as the superscript beside 7.

$\begin{array}{r} 13 \\ 5\overline{)\,6^{1}7^{2}0} \end{array}$

Now consider the last term of the dividend combine the remainder with next dividend to the right. We get a new 2 digit number 20. The divisor 5 divides 20, 4 times. Remainder 0 and the quotient becomes 134.

$\begin{array}{r} 134 \\ 5\overline{)\,6^{1}7^{2}0} \end{array}$

670 ÷ 5 = 134
