4. Call the next student. Ask him to pick another card and name the first and the second card.

5. Then ask the next student to pick a card and tell the name of the first two cards and the new card.

6. In the same way, ask all the students to take the cards one by one and tell the names in the previous cards and the name of the new card also.

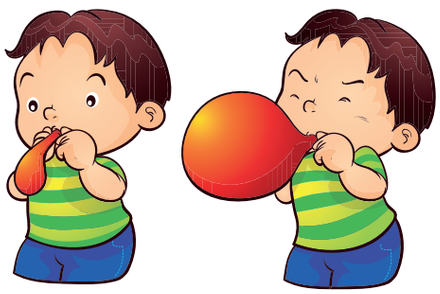

2. Lungs

Lungs are a pair of spongy, sac-like organs located in the chest. They help us to breathe.

- When we breathe in, we take in oxygen from air through the nose and pass it to the lungs. So, the lungs expands (becomes large).
- When we breathe out, we give out carbon dioxide from the lungs through the nose into the air. So, the lungs contract (becomes small).

Let us Play

Bigger and Smaller

(Teacher gives balloons to all the children)

Teacher : Blow the balloon... What do you see?

Students : It becomes bigger.

Teacher : Like this, when we breathe in, the lungs become bigger. If you let the air out from the balloon, what will happen?

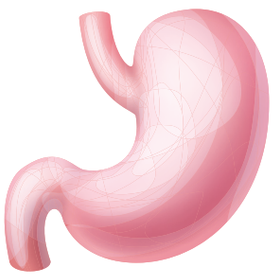

Students : The balloon becomes small.

Teacher : Yes, like this, when we breathe out air, the lungs become smaller.

The lungs act like two balloons inside our chest. As we draw air into the breathing system, the lungs get bigger as they are filled with air. When you breathe out, air is pushed out of the lungs and they get smaller.

3. Stomach

Stomach is a 'J' shaped bag found below the lungs. It breaks down food items and gives us energy. It contains special juice to digest food.
