## SOLID STATE (Ice)

Ice is a solid form of water. At temperature below $0^0$ C water becomes ice. This process is called freezing.

$$\text{Water} \xrightarrow[\text{below } 0^0C]{\text{Cooling}} \text{Ice}$$

## LIQUID STATE (Water)

Water in liquid state is available in water bodies such as oceans, river, waterfalls etc.

Write any two water bodies in your area. _____, _____.

## GASEOUS STATE (Water vapour)

Water becomes water vapour as the temperature increases due to heat. Heating forms a white mist of extremely small water droplets in the air known as water vapour.

$$\text{Water} \xrightarrow[100^0C]{\text{Heating}} \text{Water vapour}$$

## Try to Answer

1. Why water is a good example for all states of matter?
2. Which of the following is in liquid state? Rain/Ice/Snow

## Let us do

- Fill water in an ice tray and keep it in the freezer. After few hours, take it out. What happened to the water?

_____.

- Now keep this ice tray on a table for some time. What happens to the ice?

_____.

- Pour water from the ice tray into a kettle. Ask an elder at your home to heat the kettle and observe the mouth of the kettle when the water starts boiling. What do you see?

_____.
