Some more examples of adaptations are given below.

Tigers and Zebras have lines so they can hide themselves

Camels have broad feet to walk in the desert.

Fish have gills to breathe in the water and fins to swim.

Elephants have long and large trunk to get their food in the forest.

There are three basic types of adaptations seen in animals. They are,

1. Structural adaptations

Changes in the physical features of the animal are called structural adaptations.

E.g. **Polar bears** living in cold climate have physical adaptations, such as thick fur and short ears to reduce heat loss.

2. Physiological adaptations

Changes in the functions of the animal's body are called physiological adaptations.

E.g. **Dog** shivers to generate more heat when it is cold and pants when it is hot.

3. Behavioural adaptations

Changes in the activities of the animal are behavioural adaptations.

E.g. **Birds** migrate to avoid adverse conditions.
