Adverse effects of air pollution

Global warming	This changes the climatic conditions of different regions of the world. It also causes disturbances in agriculture and food production. Melting of snow caps and increase in sea levels are the consequences of global warming	
Formation of smog	When dust particles and smoke combine with fog in the presence of sunlight, smog is formed. It reduces the visibility. It also causes many respiratory disorders and allergies.	
Formation of acid rain	Sulphur dioxide and nitrogen oxides react with water in the atmosphere producing sulphuric acid and nitric acid. These acids come down along with the rain. This is called acid rain. Acid rain • causes respiratory and skin disorders • damages the leaves and affects the productivity of plants • enters the ground and river waters causing harm to the aquatic life • erodes marble and damages monuments like Taj Mahal.	 
Aerosol formation	When liquid or solid particles are dispersed in air, it is called aerosol. Aerosols are deposited on the leaves affecting photosynthesis.	
Depletion of Ozone	The hydrocarbons such as the Chloro Fluoro Carbons (CFCs) destroy the ozone layer. Ozone holes allow the UV rays to reach the earth's surface. UV radiation harms wildlife, damages plants and causes skin cancer in humans.
